
Security Aspects

- Secrets loaded from env vars:
  GVI_DB_USER / GVI_DB_PASSWORD / GVI_DB_CONNECT_STRING
  GOM_DB_USER / GOM_DB_PASSWORD / GOM_DB_CONNECT_STRING
  Special users are created to access the tables with READ intent only
- Least privilege runtime: container runs as non-root node user
- DB protection: parameterized SQL via bind parameters (no string interpolation queries)
- Operational risk: API currently returns raw error.message in 500 responses
- Gap: no explicit auth/rate limiting on API routes (important for internet-facing deployment)
  But since this deployed in external network no issues should be brough up

Deployment Pipeline

Access

Tool is access from extranet only (controlled with nginx)
Tool can be deployed on same Kubernetes cluster as current SOA integrations are running, separate k8s pods, no impact on current SOA.
No additional hardware needed
